# Introduction

Arrowwood Environmental (AE) conducted the following surveys in connection with the terrestrial component of the NECPL Project: necessary wildlife habitat, special aquatic resources, rare, threatened, or endangered species habitat, and rare and irreplaceable natural areas. The surveys were conducted from May through Mid-August of 2014. This report details the methodology employed in conducting the surveys and survey results. Included with this report is a series of GIS shapefiles, as outlined in Attachment 7. AE has also conducted an Indian Bat habitat assessment and non-native invasive species inventory which shall be submitted under separate covers.

# Study Area

The route of the study area is as follows:

- 1. Canadian Border down Bay Road to 55 Bay Road, Alburg
- 2. Exit Lake at 113 Stoney Point Road, Benson
- 3. Lake Road to Route 22A
- 4. Route 22 A to Route 4
- 5. Route 4 to Route 7
- 6. Route 7 to Route 103
- 7. Route 103 to Route 100
- 8. Route 100 to Town Roads in Ludlow
- 9. Town Roads in Ludlow

The width of the study area corridor is as follows:

 Alburg: 50 foot total width, including existing roadway surface (Town ROW) and private parcel owned by project developers.

Arrowwood Environmental

- Town Roads in Benson: 50 foot total width, including existing roadway surfaces, entirely within Town ROWs and private parcel owned by project developers.
- VT Route 22A: Entire width of VTrans or Town of Fair Haven ROWs, ~ 66 feet.
- US Route 4: Entire width of VTrans ROW on either side of paved roadway/shoulder (~125'), not including the median (North of westbound lands and South of eastbound lanes).
- 5. US Route 7: Entire width of VTrans ROW
- 6. VT Route 103: Entire width of VTrans ROW
- 7. VT Route 100: Entire width of VTrans ROW
- 8. Town Roads in Ludlow: 50 foot total width, including existing roadway surfaces, entirely within Town ROWs.

# Inventory

## 1: Necessary Wildlife Habitat Surveys

AE conducted surveys of deer wintering areas and bear feeding habitat within the study area. Each of these surveys is discussed in this section.

## 1a: Deer Wintering Areas

The white-tailed deer (*Odocoileous virginianus*) is near its northernmost range extension in Vermont. In order for the deer to thrive in Vermont, they must utilize particular habitats during periods of extended deep snow and cold temperatures during the winter months. Coniferous evergreen tree canopies provide the forest structure that both: 1) shed snows resulting in reduced snow depths; and, 2) provide overhead tree canopies shielding deer from excessive heat loss during

#### NECPL RTE, Natural Community & Critical Wildlife Habitat Inventory

winter. Mixed hardwood and evergreen forested natural communities also can provide this biological function.

Preferred species of evergreen trees utilized by white-tailed deer include Northern white cedar (*Thuja occidentalis*) and Eastern Hemlock (*Tsuga canadensis*). Balsam fir (*Abies balsamea*) and red spruce (*Picea rubens*) stands can also serve this function, but generally to a lesser degree. White pine (*Pinus strobus*), can, at times be utilized by over-wintering deer but is of considerably lesser value in fulfilling deer over-wintering habitat requirements. These evergreen forest communities retain snow in the canopy resulting in shallower winter snow depths on the ground than nearby hardwood forests. They also provide a forest canopy shielding over-wintering deer from extreme heat loss to the upper atmosphere.

The forest conditions of the study area are generally characterized as cleared along the existing roadways and varying forest edge at the limit of the ROW. These areas have been previously disturbed and for the most part do not fulfill the necessary requirements to serve as over-wintering habitats for white-tailed deer. These road edges are frequently visited by people, their pets, and often receive relatively high amounts of light both from cars and human development. Perhaps most importantly, these road sides are subject to constant noise, primarily resulting from car and truck traffic. This was especially evident regarding the well-travelled roads such as Routes 22a, 4, 7, and 103. White-tailed deer in Vermont generally develop a fidelity to the use of winter forest habitats which provide a high degree of isolation from stress causing factors such as noise, and the presence of humans and their pets. The winter of 2013-2014 was a cold and snowy winter and deer in most regions in Vermont sought shelter within so called "deeryards" or deer wintering areas (DWA).

## 1a(i) DWA Methodology

The deer wintering area survey involved both a remote review of available digital databases and aerial imagery interpretation as well as field assessment of specific habitat features within the study area. The methodology employed and the results of the survey are discussed in this section.

#### 1a(ii) DWA Remote Review

AE reviewed the existing State of Vermont Fish and Wildlife Department (Vt. F&W) Deer Wintering Area data layer. AE also remotely mapped all conifer and mixed conifer/hardwood forest stands within ¼ mile of the edge of potential disturbance for the proposed project. Stand mapping was conducted through aerial photo interpretation of the 2011-2012 Vt. Orthophotography Program false color-infrared photo series from Vermont Center for Geographic Information (VCGI). Stands with a continuous or near-continuous conifer canopy were digitized as conifer forest land-cover type, and stands with approximately 50% or more conifer canopy were digitized as mixed forest land-cover type. Stand mapping was conducted at a screen scale of 1:5000 or larger, and unit size was generally proportional to the study area size with a mean stand area of 23 acres. Stands were only mapped to edge of a ¼ mile buffer from the project area, and mapping was terminated at this boundary even if the conifer or mixed forest stand continued beyond this edge. All remotely mapped conifer and mixed-conifer stands were considered potential deer winter habitats.

As a result of the remote review approximately 162 potential deer winter habitats were identified of which approximately 78 forest stands intersected with the study area and were targeted for field review.

#### 1a(iii) DWA Field Survey

Coniferous and mixed conifer/hardwood forest communities which fell within the study area were visited in the field. Meandering surveys were conducted within

these target communities in the study area. Each potential DWA site was assessed for the appropriateness of the forest structure, (i.e. percent coniferous tree canopy cover) and dominant canopy species; as well as for their utilization by over-wintering white-tailed deer. The presence and abundance of deer winter scat piles as well as the extent of winter woody plant browse by deer was noted.

## 1a(iv) DWA Results

Approximately 78 forest stands were assessed for deer overwinter use within the study area. Forest stands with a combination of the appropriate tree species as well as adequate forest structure within the study area were rare with only five stands having both features. The table below provides summary information for these five stands.

<b>Table 1: Forest Stands With</b>	<b>Potential DWA</b>	<b>Cover Conditions</b>
------------------------------------	----------------------	-------------------------

Potential		
DWA ID	Route Segment	Potential DWA Cover Conditions
593	Route 103-Mt Holly, Ludlow	White Pine/Balsam Fir 80% cover
604	Route 103-Mt Holly, Ludlow	Red Spruce/Balsam Fir 80% cover
1058	Old North Lake Road	Hemlock 65% cover
1128	Route 103-Wallingford	Hemlock 80% cover
1139	Route 103-Mt Holly, Ludlow	Red Spruce/Balsam Fir 75% cover

There were no field observations within the evaluated forest stands revealing white-tailed deer utilization (as an over-wintering habitat). No observations of white-tailed deer winter scat piles or winter woody browse were observed within any of the evaluated forest stands.

These results are not surprising given the excessive disturbance from people and vehicular traffic within and adjacent to the study area. Evaluations did not extend beyond what was visible within the study area.

## 1b: Necessary Habitat for Black Bear

AE conducted a remote review of available databases to identify potential necessary habitat for black bear within the project area. Databases included the Black Bear Habitat in Vermont Map (VT. F&W), the Vermont Biodiversity Project "Bear Points", and the 2006 Road Kill data.

Necessary wildlife habitat for black bears falls into one of three categories: (1) travel corridors; (2) spring feeding wetlands; and, (3) fall feeding habitat consisting of mast producing trees. Each of these habitat features is discussed in relation to the project area.

#### 1b(i) Black Bear Travel Corridors

Travel corridors, also called connecting lands or connecting habitats, are land areas that serve to link other patches of important wildlife habitats together. The proposed project intersects one potential black bear travel corridor located on Rte 103 near the town line separating Mt. Holly and Ludlow. There are multiple road sighting occurrences in this area (as revealed by the digital bear points database). The area has been designated "Bear Production Habitat" by the State of Vermont on the Bear Habitat Map and there are relatively wild forestlands north and south of Route 103 in this location. In general, the designation of the area as bear production habitat suggests that quality of bear habitat in this region is sufficient to support the home ranges of breeding adult female bears.

This area appears to be part of a public and private conservation effort to facilitate bear crossing of Rte 103. Bear crossing signs were observed during the field survey effort for the project.

Within the project study area, being generally characterized as heavily disturbed by road traffic and human activity, biologically critical black bear habitat is limited or non-existent. The project study area is likely limited in function to its role as

part of a travel corridor wherein bears are moving quickly between the large uninterrupted forest blocks north and south of the roadway where more appropriate biologically critical habitat exists.

## 1b(ii) Black Bear Fall Feeding Habitat

AE reviewed the State of Vermont bear points database for presence of mast stands. There are no mapped fall feeding habitats, generally mast producing trees such as American beech (*Fagus grandifolia*), within 1/2 mile of the proposed project.

During a review of potentially significant natural communities, AE identified northern red oak (*Quercus rubra*) stands within <sup>1</sup>/<sub>2</sub> mile of the proposed project. Red oak is a mast-producing tree also used by fall-feeding black bears. Due to the existing and frequent disturbance associated with the roadways, bear use of any red oak trees within the project area is highly unlikely.

## 1b(iii) Black Bear Wetlands

Wetlands, especially forested or sheltered wetlands, are used heavily by black bear for feeding in the spring season when very little besides newly sprouting forbs and sedges are available to eat. These "Bear Wetlands" are considered critical habitat.

AE reviewed the bear points database for presence of bear wetlands. There are no bear wetlands within the study area and there are no known bear wetlands within 1/2 mile of the proposed project. As with mast trees, the existing and frequent disturbance associated with the roadways is likely to limit any bear use of wetlands close to the project study area.

## 2: Rare, Threatened and Endangered Plant Species Survey

A rare, threatened and endangered (RTE) plant species survey was conducted for the study area. The survey involved both a remote assessment of available digital databases and a detailed field survey. The methodology employed and the results of the survey are discussed in this section.

#### 2(i) RTE Remote Review

The initial step in the RTE survey was a remote assessment of known rare plant Element Occurrences (EOs) in the vicinity of the study area. This information was obtained from the Vermont Non-Game and Natural Heritage Program (NNHP) and summarized by TRC Companies, Inc (TRC). TRC in turn, provided this summarized information to AE. All known occurrence data was imported into GPS units and used as an aid during the field surveys.

#### 2(ii) RTE Plant Field Survey

As outlined by TRC in the document: *Rare, Threatened, and Endangered Species, Necessary Wildlife Habitat, and Natural Community Survey Pro*gram (April 2014) the field inventory methodology had three related protocol: 1) Perform targeted RTE plant surveys within the survey area in the vicinity of known EOs; 2) Conduct a visual meander survey of the study area; and 3) Perform RTE plant habitat assessments within and directly adjacent to the survey area in the vicinity of known EOs for species that cannot be identified during the survey period.

The first two protocols were conducted concurrently during the field survey. The third protocol was deemed to be unnecessary. The timing of the RTE surveys (outlined below) was such that species which bloomed earlier in the season (e.g. *Boechera spp.*) were identifiable in seed. Later blooming species (e.g. *Symphyotrichum spp., Desmodium spp.* and *Lespedza spp.*) were coming into bloom during the survey period. In some cases, populations not in bloom during

the first part of the survey period were re-visited later in the survey period when blooms were present and a positive identification could be made.

The targeted surveys and the meander surveys (protocols 1 and 2) were conducted by three botanists: Michael Lew-Smith, Matt Peters and Art Gilman. The surveys commenced on July 17, 2014 and concluded on August 19, 2014. Project survey area boundaries were imported into field GPS units to identify the limits of the ROW during the field surveys. Nomenclature for the RTE plant inventory followed <u>Flora of Vermont</u> by Art Gilman (in press). Plant rarity ranks were based on the Vermont NNHP list dated 6-28-2014.

If a rare plant population was discovered, a location point was recorded using professional mapping-grade GPS units, with subsequent detailed mapping conducted by sub-meter grade GPS. In some cases, sub-meter GPS mapping of the population occurred at the time of discovery. In other cases, a botanist returned to the site at a later date to map the population location with sub-meter grade GPS. This was done for efficiency of field operations and in some cases, to accommodate conclusive identification of the species following collection. Submeter accuracy of the population boundaries was obtained using Trimble professional grade handheld GPS units. Population locations were collected as either a single point at the center of the population with notes on a radius distance from the center within which the plant is present, or as multiple points defining the boundary of a larger population. Field collected GPS points were recorded at settings recommended by the device manufacturer for sub-meter accuracy, with an average of at least 30 positions per point and were postprocessed using Trimble software against Vt. Agency of Transportation CORS base station data published at: http://www.aot.state.vt.us/geodetic/default.htm.

## NECPL RTE, Natural Community & Critical Wildlife Habitat Inventory

Polygons were manually built from sub-meter GPS data following postprocessing. Where a single point was collected at the center of a small population, a circle was constructed about the point at the radius indicated by the field botanist. When multiple points were collected for a population boundary, the appropriate points were connected to form a polygon. Each polygon was linked by reference to the original mapping grade GPS point to enable transfer of all initial species, population and other metrics collected. All polygons were reviewed for quality assurance and completeness by multiple AE personnel with geometry and associated attributes adjusted as deemed appropriate by the reviewers.

All species with an S-rank of S1, S2 and S2S3 were mapped to sub-meter accuracy. Uncommon species (S3 rank) were also documented and mapped during this inventory and are included in the summary tables. S3 populations were not mapped to sub-meter accuracy and no rare plant report forms were used. S3 populations were mapped from the original mapping-grade GPS point with a default 20' diameter circle software-generated around the point to represent the general area of occurrence.

For each rare plant population, a Rare Plant Occurrence Report Form (NNHP, Vermont Fish and Wildlife) was filled out with information about the population. Since spatial data is also being submitted, a somewhat abbreviated version of this form excluding location description was used for this project. One form was completed for each rare plant population. What comprised a population was based on distance between rare plant occurrences, plant biology, barriers to dispersal and professional judgment.

Copies of the Rare Plant Occurrence Report forms are provided as Attachment 1. The forms are linked to the digital spatial data and the data table provided as Attachment 2 by using the "Population Group" code.

## 2(iv) RTE Plant Results

Fifty-three different species of uncommon, rare, threatened or endangered plant species were identified during this survey. This includes 3 state endangered and 6 state threatened species.

Summary data for all uncommon, rare, threatened or endangered plant species is provided as Attachment 2. Each record in this table is linked to the polygon (location) data by the Polygon ID field. Records with the same "Population Group" entry are considered part of the same population. Population sizes listed for each record indicate the number of plants in each individual polygon. In some cases, there are multiple polygons for each population. In a few circumstances, the number of individuals for each polygon is not known; only the total population number is known. In these instances, "Unknown" is listed in the Population Size field, followed by total population size. The Polygon Group field is linked to the RTE forms, presented in the attachment.

A complete list of plant species recorded during the RTE plant survey is provided as Attachment 3.

## 3: Rare, Threatened and Endangered Animal Survey

AE conducted a Rare, Threatened and Endangered Animal species habitat survey for the project study area. The survey involved a remote review of available digital databases. RTE wildlife habitat assessments were conducted as needed and were based on existing species records within the proposed route and incidental sightings during the plant survey.

## 3(i) RTE Animal Remote Review

The initial step in the RTE animal survey was a remote assessment of known rare animal Element Occurrences (EOs) in the vicinity of the study area. This information was obtained from the Vermont Non-Game and Natural Heritage Program (NNHP) and summarized by TRC. TRC in turn, provided this summarized information to AE. All known occurrence data was imported into GPS units and used as an aid during the field surveys.

## 3(ii) RTE Animal Field Survey

As outlined by TRC in the document: *Rare, Threatened, and Endangered Species, Necessary Wildlife Habitat, and Natural Community Survey Program* (April 2014), the field survey methodology consisted of conducting targeted RTE animal habitat assessments in the vicinity of known EOs in the study area. No *de novo* searches for RTE animals occurred during this inventory.

With the exception of Indiana Bat habitat work (report to be presented under separate cover), the RTE animal habitat inventory occurred concurrently with the RTE plant inventory and employed the same meander survey techniques. In the vicinity of existing EOs, notes were made on the habitat present with a focus on particular habitat features (such as hibernacula for snakes).

## 3(iii) RTE Animal Results

There are eighteen known EOs of RTE animals in the study area as recorded in the NNHP database. Field work has confirmed that, in most cases, general habitat features preferred by RTE animal species is present within the study area. However, no special habitat features such as hibernacula were discovered within the study area. The results of the RTE animal habitat assessments are provided as Attachment 4. The table below provides summary information about the recorded EOs in the project area.

Animal Species	S-Rank	# of EOs
Eastern Ribbonsnake	S2	2
Stinkpot (Eastern Musk Turtle)	S2	1
Eastern Ratsnake	S2	3
Upland Sandpiper	S2B	2
Fluted-Shell	S2	1
Silver Lamprey	S2	2
Timber Rattlesnake	S1	2
Cerulean Warbler	S1S2B	1
Pie-billed Grebe	S2S3B	1
Creek Heelsplitter	S2	1
Cape May Warbler	S1B	1
Indiana Bat	-	1

Table 2: Summary Data Table for Recorded Animal EOs

#### 4: Rare and Irreplaceable Natural Areas Assessment

Rare or irreplaceable natural areas (RINA) are not defined in state statutes. A subset of significant natural communities may be considered to be RINA as well as State Natural Areas. Significance is assessed according to the *Guidelines for the Conservation and Protection of State-Significant Natural Communities* (ANR 2004). The focus of this assessment was to identify potentially significant natural communities that may be considered to be RINA. Methodology for conducting this assessment followed Section 6.1 in the TRC document: *Rare, Threatened, and Endangered Species, Necessary Wildlife Habitat, and Natural Community Survey Program* (April 2014). A component of this evaluation is the mapping of nonnative invasive species (NNIS), a report of which is submitted under separate cover. Complete evaluation of entire communities, as necessary to conclusively determine state significance, was outside the scope of this survey due to access constraints outside of the study area.

#### 4(i) RINA Remote Review

The initial step in the assessment was to identify known significant community Element Occurrences (EOs) in the vicinity of the study area and the presence of State Natural Areas. This information was obtained from the NNHP database. In addition, AE remotely identified any potentially significant natural communities within <sup>1</sup>/<sub>4</sub> mile of the study area by reviewing various orthophoto imagery, topographic maps, soil surveys and VSWI wetland maps. This process was conducted for both upland and wetland natural communities. All known occurrence data, State Natural Area locations, as well as potentially significant natural communities as remotely identified was imported into GPS units and used as an aid during the field surveys.

## 4(ii) RINA Field Survey

The focus of the field work was twofold: 1) to confirm or deny that any of the known significant communities were within the study area, and 2) to assess the remotely identified potentially significant communities within the study area. The significant natural community assessments were conducted concurrent with the RTE plant survey.

For the potentially significant natural communities identified in the study area, AE gathered field information about the community type and condition. This information included canopy cover, species composition, age, disturbance and community condition. After the field work was completed, a broader analysis of the sites was conducted to include overall community size and landscape position.

The digital data submitted with this report includes a polygon shapefile of potentially significant natural communities. This submittal includes only those sites that are considered potentially significant AND occur within the study area. In addition, these natural community boundaries are clipped within <sup>1</sup>/<sub>4</sub> mile of the study area.

## 4(iii) RINA Results

As mentioned previously, sites on the list of State Natural Areas can be considered to be RINA. There are no sites within the study area that are on the list of State Natural Areas. In addition, known significant natural community occurrences (as recorded in the NNHP database) may be considered to be RINA. Fourteen different known significant natural communities occur in the vicinity of the study area. Summary data for these sites, along with results of the field survey work, are provided as Attachment 5. Fieldwork confirmed that none of these fourteen natural communities occur within the study area.

Arrowwood Environmental

## NECPL RTE, Natural Community & Critical Wildlife Habitat Inventory

An assessment of new significant natural community occurrences was conducted for both wetlands and uplands. There were no potentially significant wetland communities identified in the study area. Given the narrow, linear nature of the study area and the proximity of existing roads, very few undisturbed wetlands were present. In some cases, large state significant wetlands were in the vicinity of the study area, but did not enter into the study area and were therefore not assessed during the field work or included in this report.

The analysis of upland natural community occurrences resulted in the identification of eight potentially significant upland natural communities. Summary data for these sites are provided in Table 3 and briefly described below. In all cases, further field work would need to be conducted outside of the study area to determine the full nature and extent of the communities and draw any definitive conclusions regarding significance.

Natural Community	Mile	Comments		Rank
	Marker	Comments	Site Name	Comments
Mesic Red Oak-Northern Hardwood Forest Mesic Maple-Ash-	122.2 to 123.0 120.2 to	Standard example of type Nice mature	Herrick Mountain NE Mount Hanley	Potentially Significant Natural Community Likely Significant
Hickory-Oak Forest	120.2 to	forest	East	Natural Community
Mesic Maple-Ash- Hickory-Oak Forest	119.5 to 119.9	Very nice forest, some mature areas	Mount Hanley West	Likely Significant Natural Community
Mesic Maple-Ash- Hickory-Oak Forest	121.2 to 121.8	Very nice forest, some mature areas	Twin Mountain	Likely Significant Natural Community
Mesic Maple-Ash- Hickory-Oak Forest	117.3 to 118.1	Very nice forest, drier	Blueberry Hill	Likely significant natural community

Table 3: Summary Data for Potentially Significant Upland Natural Communities

Natural Community	Mile	Comments		Rank
	Marker	Comments	Site Name	Comments
		inclusions; larger to north		
Temperate Hemlock Forest	115.3 to 115.6	Large forest to north, somewhat disturbed along ROW	Pine Pond	Potentially Significant Natural Community
Temperate Hemlock- Hardwood Forest	114.7 to 115.2	Large mixed forest to north	Pine Pond	Potentially Significant Natural Community
Dry Oak-Hickory- Hophornbeam Forest	112.4 to 112.8	Transitional to Mesic Forest	Green Dump Hills	Potentially Significant Natural Community

## **Herrick Mountain NE**

This Mesic Red Oak-Northern Hardwood Forest is dominated by northern red oak, American ash (*Fraxinus americana*), American beech, black birch (*Betula lenta*), and white pine. The understory consists of witch hazel (*Hamamelis virginiana*), maple-leaved viburnum (*Viburnum acerifolium*) and various canopy saplings. This appears to be a fairly young forest, with DBHs averaging around 10-12". Despite the age, the forest appears to be in good condition. This is a fairly common community type, and would be a significant natural community only if the rest of the forest to the south is in very good condition.

## Mount Hanley East, Mount Hanley West, Blueberry Hill and Twin Mountain

This series of four forest communities all sit at the base of a series of dry hills in West Rutland, Ira and Castleton. They all are examples of the Mesic Maple-Ash-Hickory-Oak Forest community. They are dominated by northern red oak,

Arrowwood Environmental

#### NECPL RTE, Natural Community & Critical Wildlife Habitat Inventory

shagbark hickory (*Carya ovata*), bitternut hickory (*Carya cordiformis*), American hop hornbeam (*Ostrya virginiana*) and American ash. The understory consists of canopy species as well as maple-leaved viburnum, witch hazel, Pennsylvania sedge (*Carex pensylvanica*), wood anemone (*Anemone quinquefolia*) and blue-stemmed goldenrod (*Solidago caesia*). There are some inclusions of Dry Oak-Hickory-Hophornbeam Forest where the soils are well-drained.

While there are a few areas of more recent disturbance, most of these forests in the study area are mature and in very good condition. Given the condition, community type and size of these forests, it is likely that these communities would be considered state significant.

#### **Pine Pond**

These two forests consist of a Temperate Hemlock-Hardwood Forest and a Temperate Hemlock Forest. The canopy in the mixed forest is dominated by Eastern hemlock, red maple (*Acer rubrum*), American beech, and northern red oak. The sparse understory consists of canopy species as well as rock polypody (*Polypodium virginianum*) and evergreen woodfern (*Dryopteris intermedia*). The Hemlock Forest contains less hardwood and also includes white pine. Within the ROW, some sections of these forests are somewhat disturbed and early successional. Nevertheless, they are part of very large forests outside of the ROW to the north. Further analysis of the forests outside of the study area would need to be conducted to determine if these are significant natural communities.

#### **Green Dump Hills**

The forest at this location is best described as a Dry Oak-Hickory-Hophornbeam Forest community, though it may be transitional to the Mesic Maple-Ash-Hickory-Oak Forest. The canopy is dominated by northern red oak, American ash, white pine and American hop hornbeam. The understory is dominated by

Pennsylvania sedge. The forest continues to the north where it is interspersed with numerous state significant examples of the Dry Oak Forest community. Given its size, condition and community type, this forest is likely a state significant natural community.

## 5: Special Aquatic Sites and Special Wetlands

Special Aquatic Sites (SAS) are a U.S. Army Corps of Engineers designation which affords protection to certain types of wetlands. These wetland types are outlined in the Vermont Wetland General Permit under General Condition 27 (Department of Army Vermont General Permit, 12/11/2012). SAS include mudflats, vegetated shallows, and riffle and pool complexes. In addition, Special Wetlands are also afforded additional protection. Special Wetlands are bogs, fens, vernal pools and wetlands that provide habitat for state threatened or endangered species.

## 5(i) SAS Methodology

Wetland survey data forms for the project study area were provided to AE by TRC. These data forms were used by AE to determine if any SAS or Special Wetlands were delineated based on the Cowardin Classification. Field surveys for SAS and Special Wetlands were conducted concurrently with the RTE plant surveys and survey for significant wetland natural communities. Wetlands within the study area were visited during these inventories with the intention that any SAS or Special wetland types would be identified.

## 5(ii) SAS Results

The field inventory for SAS found no examples of mudflats or riffle and pool complexes within the study area. One site that is considered a vegetated shallow is wetland V-CN-W-105. This wetland sits on the margins of Lake Bomoseen, is permanently inundated and supports rooted aquatic vegetation. Therefore, wetland V-CN-W-105 is considered a Special Aquatic Site.

The field inventory of Special Wetlands found no examples of bogs, fens or vernal pools within the survey area. The field inventory did identify two wetlands which provide habitat for threatened plant species. Wetland V-CN-W-105 provides habitat for the threatened species Virginia chain fern (*Woodwardia virginica*). Wetland T-CL-W 13 NORTH provides habitat for the threatened marsh horsetail

(*Equisetum palustre*). Therefore, wetlands V-CN-W-105 and T-CL-W-13 North are considered Special Wetlands.

Complete List of Plant Species Recorded During the RTE Plant Survey

Appendix 3

Complete List of Plant Species Recorded During the RTE Plant Survey

Abies concolor

Acer negundo

Acer nigrum

Acer pensylvanicum

Acer platanoides

Acer rubrum

Acer saccharinum

Acer saccharum

Acer spicatum

Achillea millefolium

Aconitum napellus

Acorus calamus

Actaea pachypoda

Actaea rubra

Adiantum pedatum

Aegopodium podagraria

Ageratina altissima

Agrimonia gryposepala

Agrimonia striata

Agrostis capillaris

Agrostis gigantea

Agrostis perennans

Agrostis stolonifera

Alisma subcordatum

Allium tricoccum

Alnus incana

Ambrosia artemisiifolia

Amelanchier laevis

Amorpha fruticosa

Amphicarpaea bracteata

Survey Summary for Recorded RTE Animal EOs

	[		1				Attachment
urvey	/ Summary for Reco	rded RTE Animal	Eos				
EO ID	Scientific Name	Common Name	State Rank	State Threatened or Endangered Status	Federal Threatened or Endangered Status	Habitat Characteristics	AE Habitat Survey Results
7911	Thamnophis sauritus	Eastern Ribbonsnake	S2	SSC	-	Wetland edges with sunny exposed basking sites in warm, low- elevation, largely undeveloped areas. The presence of nearby rocky woodlands and talus increases the likelihood of their occurrence in these areas.	EO record location is approximately 1200' from th study area. Appropriate general habitat present i the study area. No obvious hibernacula identified
5418	Sternotherus odoratus	Stinkpot (Eastern Musk Turtle)	S2	SSC	-	Shallow, heavily vegetated waters of slow moving creeks, or in ponds.	EO record location is approximately 2000' south the study area. The shoreline at the Lake in the study area is rocky substrate. No surveys conducted.
7565	Pantherophis alleghaniensis	Eastern Ratsnake	S2	ST	-	Old buildings, old fields, and edges of woods near rocky areas and ledges.	Appropriate general habitat present. No hibernacula present within the study area.
10349	Thamnophis sauritus	Eastern Ribbonsnake	S2	SSC	-	Wetland edges with sunny exposed basking sites in warm, low- elevation, largely undeveloped areas. The presence of nearby rocky woodlands and talus increases the likelihood of their occurrence in these areas.	EO record location is approximately 1200' from th study area. Appopriate habitat present in the stuc area. No obvious hibernacula identified.
3223	Pantherophis alleghaniensis	Eastern Ratsnake	S2	ST	-	Old buildings, old fields, and edges of woods near rocky areas and ledges.	Appropriate general habitat present. No hibernacula present within the study area.
3874	Bartramia longicauda	Upland Sandpiper	S2B	SE	-	Large areas of grasslands, fallow fields, and meadows	Extensive potentially appropriate habitat throughout the area.
9727	Lasmigona costata	Fluted-shell	S2	SE	-	Sand, mud, or fine gravel in medium to large rivers with slow to moderate flow.	No surveys conducted
6848	Ichthyomyzon unicuspis	Silver Lamprey	S2?	SSC	-	Large streams and lakes	No surveys conducted
4546	Bartramia longicauda	Upland Sandpiper	S2B	SE	-	Large areas of grasslands, fallow fields, and meadows	Historic site of Devil' Bowl Speedway has short mowed lawn, no longer good habitat. Extensive potentially appropriate habitat throughout the are
5540	Crotalus horridus	Timber Rattlesnake	S1	SE	-	Forested rocky hills. Hibernating dens can be found in crevices in rocky, south-facing cliffs or piles of large boulders.	The Great Ledge and Rattlesnake Ridge are not within the study area. Appropriate general habit within the study area. No hibernacula present within the study area.
5869	Pantherophis alleghaniensis	Eastern Ratsnake	S2	ST	-	Old buildings, old fields, and edges of woods near rocky areas and ledges.	The Great Ledge and Rattlesnake Ridge are not within the study area. Appropriate adjacent gene habitat present. No hibernacula present within th study area.
1873	Crotalus horridus	Timber Rattlesnake	\$1	SE	-	Forested rocky hills. Hibernating dens can be found in crevices in rocky, south-facing cliffs or piles of large boulders.	Appropriate general habitat present in the study area. No hibernacula present within study area.
6871	Ichthyomyzon unicuspis	Silver Lamprey	S2?	SSC	-	Large streams and lakes	No surveys conducted
8483	Setophaga cerulea	Cerulean Warbler	\$1\$2B	SSC	-	Mature forested areas with large and tall trees of broad-leaved, deciduous species and relatively little undergrowth.	No surveys conducted
2357	Podilymbus podiceps	Pied-billed Grebe	S2S3B	SSC	-	Streams, ponds, lake and freshwater marshes.	Appropriate habitat in wetlands along the Castleto River and West Rutland Marsh. No surveys conducted
6106	Lasmigona compressa	Creek Heelsplitter	S2	-	-	Rivers and streams of various sizes. Substrates of gravel, sand, or mud.	No surveys conducted
5882	Setophaga tigrina	Cape May Warbler	S1B	-	-	Coniferous woodland	No surveys conducted
-	Myotis sodalis	Indiana Bat	-	SE	FE	Wooded areas where they roost under loose tree bark on dead or dying trees.	Survey conducted, report under separate cover

1 State Rank S1 - Very rare (Critically imperiled): At very high risk of extinction or extirpation due to extreme rarity (often 5 or fewer populations or occurrences), very steep declines, or other factors S2 - Rare (Imperiled): At moderate risk of extinction or extirpation due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors S3 - Uncommon (Vulnerable): At moderate risk of extinction or extirpation due to restricted range, relatively few populations or occurrences (often 80 or fewer), recent and widespread declines, or other factors S4 - Common to uncommon (Apparently secure): locally common or widely scattered to uncommon, but not rare; some cause for long-term concern due to declines or other factors; or stable over many decades and not threatened but of restricted distribution or other factors S5 - Common (Secure): widespread adbundant B - Breeding N - Nonbreeding H - Possibly extinct/extirpated: Missing; known from only historical occurrences but still some hope of rediscovery								
2 - State and Federal Threatened and Endangered Status								
ST - Listed as Threatened in the State of Vermont SE - Listed as Endangered in the State of Vermont SSC - Listed as Special Concern in the State of Vermont FT - Federally-listed as Threatened FE - Federally-listed as Endangered

Natural Community Survey Forms

### VERMONT NATURAL COMMUNITY SURVEY FORM Nongame and Natural Heritage Program Vermont Fish & Wildlife Department

Survey Site: Green Dump Hills			Is this an update?	EO# (	if known):
<b>Community Type:</b> Dry Oak-Hickory-Hophornbeam Fe	orest				
(For vernal pools, please use the Vernal Pool Survey Form on our websi	ite)				
Community Variant Name (if applicable):					
Association Name (NVC type) (office):					
Surveyor(s): Michael Lew-Smith			Contact Info:	mlewsr .com	nith@arrowwoodvt
Survey Date(s): 8-3-2014	Town:	Castleton		County:	Rutland
Unusual data sensitivity issues?  If so, explain:					
LANDOWNER(S) / CONTACT(S) (Name, Telephone, Unknown	, Address	s, <b>Email</b> —if	not in a Site Summa	ry Form)	Permission

#### **GENERAL DESCRIPTION of SITE**

Describe *Site* and its range and variability (give a word picture of natural and man-made features, including: general topography, elevation, exposure, community types, geologic substrata, evidence of disturbance, exotics, etc.): Variable topography. Southern end of larger forests to north. Shallow sandy loam soils.

#### NATURAL COMMUNITY INFORMATION

Describe *Natural Community* occurrence (include canopy cover, dominant species by stratum, soils, physical environment, & evidence of disturbance):

The forest at this location is best described as a Dry Oak-Hickory-Hophornbeam Forest community, though it may be transitional to the Mesic Maple-Ash-Hickory-Oak Forest. The canopy is dominated by northern red oak (Quercus rubra), American ash (Fraxinus americana), white pine (Pinus strobus) and hop hornbeam (Ostrya virginiana). The understory is dominated by Pennsylvania sedge (Carex pensylvanica). The forest continues to the north where it is interspersed with numerous state significant examples of the Dry Oak Forest community. Given its size, condition and community type, this forest is likely a state significant community as well.

Aspect: mostly south Slope (degrees): variable Elevation (with units): minimum 500+ maximum ?

Bedrock geologic type (Doll et al. 1961 or more recent): Bull Formation

Soil type or description (NRCS): Taconic-Hubbarton Complex

# **<u>COMMUNITY OCCURRENCE RANKING</u>**: a range of ranks may be used (e.g. AB)

Using VI NNHP rank	ing spec	<b>incations</b> (if available)*: OR Using <b>Generic ranking specifications</b> (provided below):
	Rank:	Comments:
Current Condition:		Further work on rest of forest needs to be conducted.
Landscape Context:		
Size:		Community size (acres) and how determined:
Overall Rank:		
	-	

\* Available for some natural communities at <u>www.vtfishandwildlife.com/wildlife\_nongame.cfm</u>. Use to fill in the grid above.

#### Generic ranking specifications:

Use the following guidelines to fill in the grid above if VT NNHP Natural Community ranking specifications are unavailable

#### **Current Condition:**

A: mature example of the community type (forests with trees generally >150 years old); natural processes intact; no exotics B: some minor alteration of vegetation structure and composition, such as by selective logging; minor alterations in ecological processes; exotics species present in low abundance

**C:** significant alteration of vegetation structure and composition, such as by heavy logging; alteration of ecological processes are significant, but community recovery/restoration is likely; exotic species are abundant and control will take significant effort **D:** ecological processes significantly altered to the point where vegetation composition and structure are very different from A-ranked condition and restoration/recovery is unlikely; exotic species are abundant or control will be difficult

#### Landscape Context:

A: highly connected; area around EO (>1,000acres) is largely intact natural vegetation, with species interactions and natural processes occurring across communities; surrounding matrix forest meets at least B specifications for Condition.

**B**: moderately connected; area around EO (>1,000acres) is moderately intact natural vegetation, with species interactions and some natural processes occurring across many communities, although temporary disturbances such as logging have reduced condition of the landscape; surrounding matrix forest meets at least C specifications for Condition

C: moderately fragmented; area around EO is largely a combination of cultural and natural vegetation with barriers to species interactions and natural processes across communities; surrounding land is a mix of fragmented forest, agriculture, and rural development

D: highly fragmented; area around EO is entirely, or almost entirely, surrounded by agriculture or urban development

#### Size:

No Generic ranking applicable. Please provide size of community in grid above.

#### Overall Rank (based on best judgment):

A: excellent estimated viability

**B:** good estimated viability

**C:** fair estimated viability

**D:** poor estimated viability

#### MANAGEMENT/PROTECTION RECOMMENDATIONS for NATURAL COMMUNITY

#### ADDITIONAL INFORMATION

Plot form(s) attached. Plot Code:

Animal list attached

Plant list attached (in addition to plot forms)

] Map of route taken and observation points—or include with Natural Community map.

Photographs

Comments that do not fit in another field: Further work needs to be conducted on larger forest to make final significance determination. Forest only assessed in the Route 4 right-of-way.

### MAPPING

MINITING

#### **GENERAL DESCRIPTION of SITE**

Describe *Site* and its range and variability (give a word picture of natural and man-made features, including: general topography, elevation, exposure, community types, geologic substrata, evidence of disturbance, exotics, etc.): Variable topography. Northeasten corner of large RONH forest. Loam and sandy loam soils. Some surficial rock.

#### NATURAL COMMUNITY INFORMATION

Describe *Natural Community* occurrence (include canopy cover, dominant species by stratum, soils, physical environment, & evidence of disturbance):

This Mesic Red Oak-Northern Hardwood Forest is dominated by northern red oak (Quercus rubra), American ash (Fraxinus americana), American beech (Fagus grandifolia), black birch (Betula lenta), and white pine (Pinus strobus). The understory consists of witch hazel (Hamamelis virginiana), maple-leaved viburnum (Viburnum acerifolium) and various canopy saplings. This appears to be a fairly young forest, with DBHs averaging around 10-12". Despite the age, the forest appears to be in good condition. This is a fairly common community type, and would be a significant natural community only if the rest of the forest to the south is in very good condition.

Aspect: variable Slope (degrees): variable Elevation (with units): minimum 500+ maximum ?

Bedrock geologic type (Doll et al. 1961 or more recent): Bull Formation

Soil type or description (NRCS): Macomber-Taconic Complex

Overall Rank:		
	-	

\* Available for some natural communities at <u>www.vtfishandwildlife.com/wildlife\_nongame.cfm</u>. Use to fill in the grid above.

#### Generic ranking specifications:

Use the following guidelines to fill in the grid above if VT NNHP Natural Community ranking specifications are unavailable

#### **Current Condition:**

A: mature example of the community type (forests with trees generally >150 years old); natural processes intact; no exotics B: some minor alteration of vegetation structure and composition, such as by selective logging; minor alterations in ecological processes; exotics species present in low abundance

**C:** significant alteration of vegetation structure and composition, such as by heavy logging; alteration of ecological processes are significant, but community recovery/restoration is likely; exotic species are abundant and control will take significant effort **D:** ecological processes significantly altered to the point where vegetation composition and structure are very different from A-ranked condition and restoration/recovery is unlikely; exotic species are abundant or control will be difficult

#### Landscape Context:

A: highly connected; area around EO (>1,000acres) is largely intact natural vegetation, with species interactions and natural processes occurring across communities; surrounding matrix forest meets at least B specifications for Condition.

**B**: moderately connected; area around EO (>1,000acres) is moderately intact natural vegetation, with species interactions and some natural processes occurring across many communities, although temporary disturbances such as logging have reduced condition of the landscape; surrounding matrix forest meets at least C specifications for Condition

C: moderately fragmented; area around EO is largely a combination of cultural and natural vegetation with barriers to species interactions and natural processes across communities; surrounding land is a mix of fragmented forest, agriculture, and rural development

D: highly fragmented; area around EO is entirely, or almost entirely, surrounded by agriculture or urban development

#### Size:

No Generic ranking applicable. Please provide size of community in grid above.

#### Overall Rank (based on best judgment):

A: excellent estimated viability

**B:** good estimated viability

**C:** fair estimated viability

**D:** poor estimated viability

#### MANAGEMENT/PROTECTION RECOMMENDATIONS for NATURAL COMMUNITY

### VERMONT NATURAL COMMUNITY SURVEY FORM Nongame and Natural Heritage Program Vermont Fish & Wildlife Department

est
ct Info: lewsmith@arrowwoodvt.c om
County: Rutland
Summary Form) Permission

#### GENERAL DESCRIPTION of SITE

Describe *Site* and its range and variability (give a word picture of natural and man-made features, including: general topography, elevation, exposure, community types, geologic substrata, evidence of disturbance, exotics, etc.): Variable topography. Southern end of larger forests to north. Silt loam soils, bedrock outcrops common.

#### NATURAL COMMUNITY INFORMATION

Describe *Natural Community* occurrence (include canopy cover, dominant species by stratum, soils, physical environment, & evidence of disturbance):

These two forests consist of a Temperate Hemlock-Hardwood Forest and a Temperate Hemlock Forest. The canopy in the mixed forest is dominated by hemlock (Tsuga canadensis), red maple (Acer rubrum), American beech (Fagus grandifolia), and northern red oak (Quercus rubra). The sparse understory consists of canopy species as well as rock polypody (Polypodium virginianum) and evergreen woodfern (Dryopteris intermedia). The Hemlock forest contains less hardwood and also includes white pine (Pinus strobus). Within the ROW, some sections of these forests are somewhat disturbed and early successional. Nevertheless, they are part of very large forests outside of the ROW to the north. Further analysis of the forests outside of the study area needs to be conducted to determine if these are significant natural communities.

Aspect: variable Slope (degrees): variable Elevation (with units): minimum 500+ maximum ?

Bedrock geologic type (Doll et al. 1961 or more recent): West Castleton Formation

Soil type or description (NRCS): Taconic-Hubbarton Complex

# **<u>COMMUNITY OCCURRENCE RANKING</u>**: a range of ranks may be used (e.g. AB)

#### **GENERAL DESCRIPTION of SITE**

Describe *Site* and its range and variability (give a word picture of natural and man-made features, including: general topography, elevation, exposure, community types, geologic substrata, evidence of disturbance, exotics, etc.): Variable topography, mostly south facing, Southern end of large MAHO forests to north. Loam and sandy loam soils. Some surficial rock. Some bedrock outcrops

#### NATURAL COMMUNITY INFORMATION

Describe *Natural Community* occurrence (include canopy cover, dominant species by stratum, soils, physical environment, & evidence of disturbance):

This series of four forest communities all sit at the base of a series of dry hills in West Rutland, Ira and Castleton. They all are examples of Mesic Maple-Ash-Hickory-Oak Forest community. They are dominated by northern red oak (Quercus rubra), shagbark hickory (Carya ovata), bitternut hickory (Carya cordiformis), hop hornbeam (Ostrya virginiana) and american ash (Fraxinus americana). The understory consists of canopy species as well as maple-leaved viburnum (Viburnum acerifolium), witch hazel (Hamamelis virginiana), Pennsylvania sedge (Carex pensylvanica), wood anemone (Anemone quinquefolia) and blue-stemmed goldenrod (Solidago caesia). There are some inclusions of Dry Oak-Hickory-Hophornbeam Forest where the soils are well-drained.

While there are a few areas of more recent disturbance, most of these forests in the study area are mature and in very good condition. Given the condition, community type and size of these forests, it is likely that these communities would be considered state significant.

Aspect: mostly southern Slope (degrees): variable Elevation (with units): minimum 500+ maximum ?

Bedrock geologic type (Doll et al. 1961 or more recent): Mostly the Bull Formation

Soil type or description (NRCS):	
Mostly Macomber-Taconic Complex

**GIS Data Deliverables Description** 

Attachment 7

#### **GIS Data Deliverables Descriptions**

File Name	Geometry Type	Description	Source	Accuracy	Notes
Invasive_LocalPts.shp	Point	Local (small or isolated) populations of invasive species	Field collected GPS Data	assumed +/- 30'	Locations as collected by field ecologists
Invasive_LinearPts.shp	Point	Start and End points of linear (extensive) populations of invasive species	Field collected GPS Data	assumed +/- 30'	Locations as collected by field ecologists
Invasive_LinearLines.shp	Line	Linear representation of extensive invasive species populations	Auto and manually processed from Invasive_LinearPts. shp	None- this data is representative of population length and general area only.	This data is provided to facilitate visualization and approximate quatification of the field data provided in Invasive_LinearPts.shp. This dataset does not purport to accurately represent exact locations of populations or plant locations within the study area, but only to indicate the general linear position and extent ALONG and parallel to the study area. The data may be used to determine approximate lengths of invasive infestations. The lines are offset a predetermined amount from the road centerline. In addition, to facilitate visualization, each species is offset slightly to avoid overlaps and enable cartographic visualization.
NatComm_Significant.shp	Polygon	Approximate boundaries of potentially significant natural communities within 1/4 mile of the proposed project	screen digitized	analysis and aerial photo interpretation. Boundaries are not	This data is a subset of remotely mapped potentially significant natural communities mapped within $^{1/4}$ mile of the project study area. These polygons represent communities within which landscape characteristics supported confirmation of natural community type and condition as evaluated from within the project study area.
DWA_Potential.shp	Polygon	Approximate boundaries of potential deer winter habitats within 1/4 mile of the proposed project	screen digitized	analysis and aerial photo interpretation. Boundaries are not	This data is a subset of remotely mapped conifer and mixed conifer/hardwood forest stands mapped within ~1/4 mile of the project study area. These polygons represent stands within which forest conditions were found favorable for deer winter use when evaluated only within the project study area.
RTE.shp	Polygon	Approximate locations of Uncommon (S3) plant		Sub-meter grade GPS (S1-S2) and assumed +/- 30' (S3)	Locations as collected by field ecologists
